The invention relates to a novel method for generating a secreted trimeric fusion protein. The method comprises creating a DNA construct comprising a transcriptional promoter linked to a template encoding a signal peptide sequence followed, via an in-frame fusion, to the polypeptide to be trimerized, which in turn is joined in-frame to a polypeptide to be trimerized, and introducing the construct into a first polypeptide to be trimerized, and introducing the construct into a circ polypeptide to be trimerized, and introducing the construct into a circ polypeptide to be trimerized, and introducing the construct into a confirst polypeptide to be trimerized, and introducing the construct into a confirm the extracellular ligand-binding domain, may be used to intercept a configuration of the overactivation of a receptor during disease treatment. Trimeric receptor decoys theoretically should have a much rationally designed soluble trimeric receptor analogs could significantly increase clinical benefite, as well as lower the amount or frequency of drug injections for each patient. The method of the invention may be useful for generating a secreted trimeric fusion protein to be used for more efficient neutralization of the biological activities of their naturally occurring trimeric ligands. The current sequence is that of the human soluble TNP-RII-human collagen alpha(I) C-propeptide T2 fusion DNA (sTMF-RII-T2) of the invention. The collagen T2 construct includes a matated BMP-I recognition site but does not contain the glycine-repeat
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                    1023

The invention relates to a novel method for generating a secreted trimeric fusion protein. The method comprises creating a DNA construct comprising a transcriptional promoter linked to a template encoding a signal peptide sequence followed, via an in-frame fusion, to the capala peptide to be trimerized, which in turn is joined in-frame to a polypeptide copable of self-trimerization which is heterologous to the first polypeptide to be trimerized, and introducing the construct into a polypeptide capable of self-trimerization which is heterologous to the first polypeptide to be trimerized, and introducing the construct into a construct call. Receptor decoys, e.g. soluble receptors consisting of only the extracellular ligand-binding domain, may be used to intercept a cligand and thus overcome the overactivation of a receptor during disease ligand and thus overcome the overactivation of a receptor during disease treatment. Trimeric receptor decoys theoretically should have a much higher affinity to their ligand than their dimeric counterparts. Such rationally designed soluble trimeric receptor analogs could significantly correspond soluble trimeric rushom to frequency of drug injections for each patient. The method of the invention may be useful for generating a secreted trimeric fusion protein to be used for more efficient neutralization of the biological activities of their naturally occurring trimeric ligands. The current sequence is that of the human collagen alpha(1) C-propeptide TO construct connected triple helical region.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                          136

                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                   g
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                    Š
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                            g
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                         The invention relates to a novel method for generating a secreted trimeric fusion protein. The method comprises creating a DNA construct comprising a transcriptional promoter linked to a template encoding a comprisating a transcriptional promoter linked to a template encoding a signal peptide sequence followed, via an in-frame fusion, to the polypeptide to be trimerized, which in turn is joined in-frame to a polypeptide to be trimerized, and introducing the construct into a cukaryotic cell. Receptor decoys, e.g. soluble receptors consisting of only the extracellular ligand-binding domain, may be used to intercept a ligand and thus overscome the overactivation of a receptor during disease treatment. Trimeric receptor decoys theoretically should have a much higher affinity to their ligand than their dimeric counterparts. Such the reatment. Trimeric receptor analogs could significantly increase clinical benefits as well as lower the amount or frequency of drug injections for each patient. The method of the invention may be useful for generating a secreted trimeric fusion protein to be used for more efficient neutralization of the biological activities of their naturally occurring trimeric ligands. The current sequence is that of the human soluble TNF-RII-human collagen alpha(I) C-propeptide TO tuston DNA

                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                        The invention relates to a novel method for generating a secreted trimeric fusion protein. The method comprises creating a DNA construct comprising a transcriptional promoter linked to a template encoding a signal peptide sequence followed, via an in-frame fusion, to the polypeptide to be trimerized, which in turn is joined in-frame to a polypeptide capable of self-trimerization which is heterologous to the first polypeptide to be trimerized, and introducing the construct into a cukaryotic cell. Receptor decoys, e.g. soluble receptors consisting of only the extracellular ligand-binding domain, may be used to intercept a ligand and thus overcome the overactivation of a receptor during disease treatment. Trimeric receptor decoys theoretically should have a much higher affinity to their ligand than their dimeric counterparts. Such this cationally designed soluble trimeric receptor analogs could significantly increase clinical benefits, as well as lower the amount or frequency of drug injections for each patient. The method of the invention may be used for maturally occurring trimeric ligands. The current sequence is that of the human soluble CD4-human collagen alpha(I) C-propeptide TO fusion DNA human soluble CD4-human collagen alpha(I) C-propeptide TO fusion DNA human soluble CD4-human collagen alpha(I) C-propeptide TO fusion DNA human soluble CD4-human collagen alpha(I) C-propeptide TO fusion DNA human soluble CD4-human collagen alpha(I) C-propeptide TO fusion DNA human soluble CD4-human collagen alpha(I) C-propeptide TO fusion DNA human soluble CD4-human collagen alpha(I) C-propeptide TO fusion DNA human soluble CD4-human collagen alpha(I) C-propeptide TO fusion DNA human soluble CD4-human collagen alpha(I) C-propeptide TO fusion DNA human soluble CD4-human collagen alpha(I) C-propeptide TO fusion DNA human soluble CD4-human collagen alpha(I) C-propeptide TO fusion DNA human soluble CD4-human collagen alpha(I) C-propeptide TO departs a partial alpha CD4-human collagen alpha(I) C-propeptide TO departs a partial 
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                       1505 CCGTGACCTCAAGATGTGCCACTCTGACTGGAAGAGTGGGAGAGTACTGGATTGACCCCAA 1564
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                               1385 TGATGCCAATGTGGTTCGTGACCGTGACCTCGAGGTGGACACCACCACCACTCAAGAGCCTGAG 1444

                                                                                                                                                                      ð
                                                                                                                                                                            The invention relates to a novel method for generating a secreted trimeric fusion protein. The method comprises creating a DNA construct comprising a transcriptional promoter linked to a template encoding a signal peptide sequence followed, via an in-frame fusion, to the cignal peptide to be trimerized, which in turn is joined in-frame to a colypeptide capable of self-trimerization which is hereologous to the first polypeptide to be trimerized, and introducing the construct into a cukaryotic cell. Receptor decoys, e.g. soluble receptors consisting of coly the extracellular ligand-binding domain, may be used to intercept a ligand and thus overcome the overactivation of a receptor during disease treatment. Trimeric receptor decoys theoretically should have a much rationally designed soluble trimeric receptor analogs could significantly increase clinical benefits, as well as lower the amount or frequency of increase clinical benefits, as well as lower the amount or frequency of cuseful for generating a secreted trimeric fusion protein to be used for more efficient neutralization of the biological activities of their current sequence is that of the numan placental alkaline phosphatase (AP)-human collagen alpha (I) corpropertide TO fusion DNA (AP-TO) of the invention. The collagen TO construct includes a partial glycine-repeat triple helical region.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                 2032

The invention relates to a novel isolated polymucleotide comprising any of the 235 nucleotide sequences described in the specification. The invention further comprises: an isolated polymucleotide encoding a polypeptide with biological activity, where the polymucleotide hybridizes to one of the 235 novel polymucleotides under stringent hybridization conditions, or having greater than about 99% sequence identity with the novel polymucleotide; a vector comprising a novel polymucleotide; an expression vector comprising the novel polymucleotide; and expression vector comprise the novel polymucleotide; a host cell contains associated with a regulatory sequence that modulates operatively associated with a regulatory sequence that modulates polymucleotide in the host cell; an isolated polymucleotide in the host cell; an isolated polymucleotide in the host cell; an isolated polymucleotide in the novel polymucleotide; a composition comprising the polypeptide and a carrier; an antibody

directed against the polypeptide; a method for detecting the novel polymucleotide in a sample; a method for detecting the polypeptide in a sample; a method for detecting the polypeptide in a sample; a method for identifying a compound that binds to the polypeptide; a method for producting the polypeptide; an isolated polypeptide comprising any of the 235 amino acid sequences described in the specification; and a collection of polymucleotides comprising of at least one of the polymucleotides cited above. The polypeptides and polymucleotides of the invention have antiinflammatory, cytostatic, and antimicrobial activities. The novel polymucleotide may be used to treat disorders by gene therapy. The polypeptides and polymucleotides are useful for treating inflammation, leukaemias, nervous system disorders, or infections. This sequence represents one of the 235 novel isolated

The present invention describes a method for assessing whether a patient is afflicted with breast cancer. The method comprises comparing the level of expression of a marker (gene/polygeptide see ACCS0076 to ACCS0334 and ABR47386 to ABR47381 in a patient sample and the normal level of expression of the marker in a control non-breast cancer sample, where a patient sample and the normal level of expression of the marker in the patient sample and the normal level is an indication that the patient is afflicted with breast cancer. The breast cancer associated sequences from the present invention have cycostatic activities and can be used in gene therapy. The method is useful for diagnosing and treating breast cancer. N.B. The sequence data for this patent did not form part of the printed specification, but was obtained in electronic format directly from WIPO

The invention relates to a novel method for diagnosing and analysing autoimmune disease or arthritides. The method comprises obtaining a cutoimmune disease or arthritides. The method comprises obtaining a patient sample containing mRNA, analysing gene expression using the mRNA that results in a gene expression signature of the mRNA, and using that compression signature to diagnose or analyse the autoimmune disease or arthritides in the patient, where gene expression of at least 60% of the genes correlates with that of the gene signature. The invention of turther comprises: a treatment of theumatoid arthritis; identification of turther comprises: a treatment of rheumatoid arthritis; dentification of other than a mouse; diagnosis of rheumatoid arthritis; diagnosis or array or gene chip, specific for rheumatoid arthritis; diagnosis or analyses of autoimmune disease or rheumatoid arthritis; screening the efficacy of a candidate drug in vitro for the treatment of collagentinduced arthritis. The compositions of the invention have the following continuous and treating autoimmune disease or arthritides, such as antigout, antimflammatory, dermatological, and immunosuplatory. The methods and compositions of the present invention are useful for methods and treating autoimmune disease or arthritides, such as themmatoid arthritis, lupus, ankylosing spondylitis, fibrositis, crepresents a DNA sequence relating to the genes used in the analysis and treatment of autoimmune diseases or arthritides; such as treatment of autoimmune diseases or arthritides; such as treatment of autoimmune disease or arthritides; such as the expensent of autoimmune diseases or arthritides; such as the expense or a part or the genes used in the analysis and treatment of autoimmune diseases or arthritides. Note: This sequence is the expense or a proposition of the genes used in the analysis and the expense or the form of a proposition of the genes arthritides. Note: This sequence is the expense or the form of the form of the genes of the control of th
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                3835

                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                    The invention relates to a novel method for detecting soft tissue sarcoma which comprises obtaining a first soft tissue sample from an individual detained anomal soft tissue sample from the same or different individual, determining the expression of a gene in both samples and comparing the expression of the gene in both soft tissue samples, where a higher level of protein expression in the first soft tissue sample indicates the presence of soft tissue sarcome the invention has cytostatic applications and may be useful for detecting soft tissue sarcoma, possibly via gene therapy or vaccine production. The nucleic acid sequences may be useful in diagnostic and screening applications. The current sequence is that of a human soft tissue sarcoma-upregulated by the invention. The current sequence is not shown within the specification per se but was submitted in CD format by the inventor.

The present invention relates to a method (M1) for diagnosing breast cancer in a patient. The method comprises comparing the level of cancer in a patient. The method comprises comparing the level of expression of one or more genes or gene products in a biological sample from the patient with that in a normal patient sample, where a difference in the gene expression in the first sample compared to that in the second sample is a diagnostic of the disease. Also claimed are: method (M2) for distinguishing between normal and disease tissues; method (M3) for monitoring the response of a breast cancer patient to treatment with an anti-cancer agent; method (M4) for identifying a compound for treating continuation and array for distinguishing between normal and disease tissues comprising two or more probes corresponding to genes selected from ADR99121 and the gene products are polypeptides selected from ADR99121 and the gene products are polypeptides selected from ADR99121 and the gene products are polypeptides selected from ADR99121 and the gene products are polypeptides selected from ADR99122. ADR99121 and diagnosing breast cancer. M2 and the array are useful for diagnosing breast cancer. M2 and the array are useful for distinguishing between normal and disease tissue. M3 is useful

                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                               The invention comprises a method for diagnosing colon cancer in an individual, the method involves obtaining a serum sample from the individual and detecting the presence of either TIMP1 or Regl-alpha and an additional colorectal cancer-associated marker. The method of the invention is useful for diagnosing colon cancer in an individual. The present DNA sequence represents a human colorectal cancer-associated protein coding sequence of the invention.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                CCGTGACCTCAAGATGTGCCCACTCTGACTGGAAGAGTGGAGGAGTACTGGATTGACCCCAA

                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                            496
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                     376
                                      The invention relates to a method of detecting lineage-specific cells in a biological sample which comprises identifying lineage-specific mRNA in the sample. The methods are useful for determining the clinical outcome of a progenitor cell transfer in a subject, and for identifying or quantifying lineage-specific cells. The present sequence represents a human cDNA that encodes a protein used to identify lineage-specific
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                           TGATGCCAATGTGGTTCGTGACCGTGACCTCGAGGTGGACACCACCCTCAAGAGCCTGAG

18. strand cDNA was primed with a NotI-oligo(dT) primer. Five prime
18. end enriched, double-strand cDNA was digested with Not I and cloned
19. into the Not I and EcoRV sites of the pcMVSPORT 6 vector. Library
19. was not normalized. Library was constructed by Life Technologies, a
19. division of Invitrogen.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                             AL568796 1035 bp mRNA linear EST 05-APR-2004

EXT project with full-length enriched cDNA libraries carried out in
Animal Genome Research Program (Japan) by National Institute of
Agrobiological Sciences and STAFF-Institute
Single pass sequencing of clones derived from oligo-capped cDNA
library
Vector sequences were eliminated by RepeatMasker version 2002/07/13
and crossmatch version 0.990319
Low quality bases were trimmed based on the quality values.

```

```
/ncce="Organ: Ovarian cortex; Vector: Lambda ZAP Express; Site_1: EcoR1; Site_2: Xhol; A bovine ovarian cortex cDNA library was constructed using the Lambda Zap Express/Gigapack cloning kit (Stratagene cloning systems). Express/Gigapack cloning kit (Stratagene cloning systems). CDNA synthesis was carried out using an oligo-(dT) primer for the reverse transcription of 5(g of mRNA and the library was constructed by directional cloning EcoR1-Xhol based on manufacturers instructions. An insert: vector ligation ratio of 1:5 was chosen as most optimum. The lambda library was packaged with Gigapack III gold packaging extracts and plated on the E. coli cell line XLI-Blue MRF'."

Est project with full-length enriched cDNA libraries carried out in
Animal Genome Research Program (Japan) by National Institute of
Agrobiological Sciences and STAFF-Institute
Single pass sequencing of clones derived from oligo-capped cDNA
library
Vector sequences were eliminated by RepeatMasker version 2002/07/13
and crossmatch version 0.990319

No. is the number of results predicted by chance to have a score greater than or equal to the score of the result being printed, and is derived by analysis of the total score distribution.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                  Sequence 257,
